

Ikena is a software company that makes software for video enhancement and analysis. It was founded by Dr. Steve Mc Cormick in 2006 and has since made innovative contributions to the field of digital signal processing, developing new algorithms and implementing them on GPU's to provide real-time enhancements for broadcast or streaming video while lowering power consumption. This post will introduce the Ikena 14rar, their newest product that can be used with any NLE system to enhance videos with just one click. - Making your videos look better - Changing the color of the video to make it look good on any system. - Upgrading your image processing to take advantage of the GPU. - Allowing for real time processing, so you can improve your video editing faster. The Ikena 14rar is their newest product that has been released in August 2014 that allows users to get amazing results with just one click. This software is built upon the many years of research and development done by Dr. Steve Mc Cormick at Ikena, Inc., including innovations for media editing, real time image processing and graphic design. The Ikena 14rar is built upon the CUDA architecture and allows users to upgrade their image processing to take advantage of the GPU. This application can be used in movie editing for such tasks such as color correction, stabilization, noise reduction etc. The software is designed to be easy to use and install. It comes with a user-friendly interface that allows users to select one or more files and click a button for real time processing. It also comes with a video tutorial that gives you a brief overview of how the program works. The Ikena 14rar provides an easy way for any NLE system around the world to use this technology for saving time while editing videos. Ikena's algorithm is based on 3 main pillars: -A very fast motion estimation algorithm that allows for motion tracking in real time. This technology includes the use of "patches" to speed up this process. -An edge map to detect the area of the video that needs to be modified. For example, when you want to apply an effect (such as stabilization) it asks the user to select what area they want to modify before processing it in order for the users to obtain better results. - A high quality algorithm that compresses and decompresses videos in real time without degrading them in anyway, allowing for an HD finish product with minimal lag.
